

Boolean Indexing with NumPy: Takeaways

Syntax

READING CSV FILES WITH NUMPY

- Reading in a CSV file:

```
import numpy as np

taxi = np.genfromtext('nyctaxis.csv', delimiter=',', skip_header=1)
```

BOOLEAN ARRAYS

- Creating a Boolean array from filtering criteria:

```
np.array([2,4,6,8]) < 5
```

- Boolean filtering for 1D Nddarray:

```
a = np.array([2,4,6,8])

filter = a < 5

a[filter]
```

- Boolean filtering for 2D Nddarray:

```
tip_amount = taxi[:,12]

tip_bool = tip_amount > 50

top_tips = taxi[tip_bool, 5:14]
```

ASSIGNING VALUES

- Assigning values in a 2D Nddarray using indices:

```
taxi[28214,5] = 1

taxi[:,0] = 16

taxi[1800:1802,7] = taxi[:,7].mean()
```

- Assigning values using Boolean arrays:

```
taxi[taxi[:, 5] == 2, 15] = 1
```

Concepts

- Selecting values from a Narray using Boolean arrays is very powerful. Using Boolean arrays helps us think in terms of filters on the data, instead of specific index values (like we did when working with Python lists).
